Comparative results over 60 days treatment

Client: 75-year-old male with arrhythmia, arteriosclerosis, osteoporosis, edema. 53% strengthening cerebral arteries | 54 % strengthening aorta

'Research' mode allows to compare the received signals from the head-phones to the etatons. The results are presented on the Flendler's scale.
6 various icons designating the following levels(Fig.23):

	1 lower limit of normal		4 mild changes (pre-clinical stage of disease)
	2 standard		5 change of the average degree (clinical stage of disease)
	3 upper limit of normal (transition state, the functional changes)		6 pronounced changes
